If that's a Fobco 'Star' I have one - the quill on mine is returned by quite a strong spring, and doesn't drop back at all - I'd guess that the spring in yours is broken or missing. The depth gauge is screwed out of the way when not it use, so it shouldn't have any effect. The quill needs greasing 'little and often', and don't miss the grease-point on the quill itself, visible only when ...

The Milling Machine is also known as book 4 from the best selling 7 book series, 'Build Your Own Metal Working Shop From Scrap'. Especially designed for the developing home shop. It's a horizontal

mill, but it has the full range of vertical mill capability when used with the angle plate on the work table. Extremely rigid and versatile. The work table is 2 3/8" x 12" with a 3/8" T-slot and it travels a full 12". Eight speeds from 43 rpm to 2430 rpm. The spindle raises as much as 6" above the work table and the transmission is designed to follow the vertical travel without straining the column or changing the belt tension. Accessories included in the project are angle plate, face plate, fly cutter, tail-stand and compound slide assembly with which you can do large swing lathe jobs. Still no need to look for outside help. It's a mill and more, and you can build it your self.

DIY. A fully illustrated step-by-step guide with 100 sketches and technical drawings, this book also contains a comprehensive range of data which is required in the metal working workshop, and by those designing a wide range of engineered items, tools and machines. This book intended for shop use tries to familiarize the reader with the peculiarities of a hardening method which due to its many advantages is now in use, many shops. A general knowledge of the principles of hardening and heat treating is presumed. Introduction 1. The name of the process. Flame hardening is a method derived from the old quench hardening and is used for the surface hardening of heat treatable steels. Flame hardening is so named in analogy to flame cutting as the use of a flame is a distinctive feature of this process as opposed to the use of a furnace. 2. Characteristics of flame hardening. In flame hardening the area to be hardened is heated with a burner of large heat capacity (approx. 0.5 · 10 kcal/jhr/ meter of flame lengths or 50,000 BTU/hr/inch of flame length) supplied with a mixture of fuel gas and oxygen. The hardening temperature is thus reached in so short a time at the surface that a heat jam is created, that is, more heat is supplied to the surface than can be dissipated to the interior of the workpiece. As the quenching takes place immediately after the heating the penetration of the heat to greater depth is prevented and only the outer layer subject to wear is hardened. The core of the workpiece remains unaffected by this heat treatment in contrast to the other hardening methods where the entire piece is through heated in a furnace.
